

PraeBirth

Intelligent staffing of your maternity ward

Midwives are a scarce resource, making efficient staffing a critical priority. Couples in labor expect the best care, so staffing a maternity ward correctly is important. But also, difficult. Using advanced statistics, we can forecast the daily number of births 90 days in advance, allowing you to plan optimally.

Women rarely give birth on the due date - some deliver early, while others deliver late. This unpredictability makes staffing a maternity ward challenging.

However, with advanced statistical methods, we can quite precisely forecast the daily number of deliveries for any maternity ward up to 90 days in advance.

With PraeBirth, we will help you roster your midwives optimally, ensuring satisfied staff, happier couples, and improved financial outcome.

What is required from you?

Very little. All we need are the expected and actual due dates of couples under your care from the past two years.

Based on this data, we develop a model tailored specifically to your department.

Once you provide us with expected due dates in the future, we automatically forecast deliveries 90 days in advance.

Why choose our system?

Because it works. Unlike other methods - whether relying on staff estimates or spreadsheets - our forecasts are far more precise.

Interested?

Contact us at contact@praemostro.com or call +45 25 56 30 20. Our pricing is competitive, and you'll break even by using the system just once a week.
